1 Key Features

- Operating characteristics
 - Voltage range: 2.7 to 5.5 V
 - Temperature range (ambient): -40 to 125°C
- Performance
 - Up to 100 MHz ARM® Cortex-M3 core
 - Single cycle 32-bit x 32-bit multiplier
 - Fast I/O access port
- Memories and memory interfaces
 - Up to 256 KB flash
 - Up to 64 KB RAM
- Clocks
 - Oscillator (OSC) - supports 4 MHz to 30 MHz crystal or ceramic resonator; choice of low power or high gain oscillators
 - Internal clock source (ICS) - internal PLL with internal or external reference, 8 MHz pre-trimmed internal reference for 100 MHz system clock
 - Internal 32 kHz low-power oscillator (LPO)
- System peripherals
 - Power management module (PMC) with three power modes: Run, Wait, Stop
 - Low-voltage detection (LVD) with reset
 - Watchdog with independent clock source(WDOG)
 - Programmable cyclic redundancy check module(CRC)
 - Serial wire debug (SWD) & JTAG interfaces
- Cortex®-M3 Embedded Trace Macrocell™
- Aliased SRAM bitband region (BIT-BAND)
- One 12-channel DMA
- Human-machine interface
 - Up to 68 general-purpose input/output (GPIO)
 - External interrupt (IRQ)
- Analog modules
 - One up to 16-channel 12-bit SAR ADC, operation in Stop mode, optional hardware trigger (ADC)
 - Two analog comparators containing a 6-bit DAC and programmable reference input(ACMP)
- Timers
 - One 6-channel PWM
 - Three 2-channel PWM
 - One 8-channel periodic interrupt timer (TIMER)
 - One pulse width timer (PWDT)
 - One real-time clock (RTC)
- Communication interfaces
 - Two SPI modules (SPI)
 - Up to SIX UART modules (one support Software LIN)
 - Two I2C modules (I2C)
 - Two CAN module (CAN)
 - One Hardware Lin module(LIN)
- Package options
 - 80-pin LQFP
 - 64-pin LQFP

2 Part identification

2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

2.2 Format

Part numbers for this device have the following format:

AC## GTUFPN

2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Table 1. Fields

Field	Description	Values
AC##	ATC mcu family	• AC78
G	Generation	• 1= the first generation
T	Temperature range (°C)	• 1= AEC-Q100 Grade 1 • 3= AEC-Q100 Grade 3 • 5= 85°C
U	User flash memory size	• Q = 256 KB • O = 128 KB • M = 64 KB • J = 32 KB
F	Grade definition	• B = Normal Grade • J = BCM Grade
P	Package identifier	• F = 64 (7 mm x 7 mm) • G = 80 (10 mm x 10 mm)
N	Packaging type	• E = LQFP

2.4 Example

This is an example part number: AC7811QBGE.

3 Parameter classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 2. Parameter classifications

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

4 Ratings

4.1 Thermal handling ratings

Table 3. Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
TSTG	Storage temperature	-55	150	°C	1
TSDR	Solder temperature, lead-free	—	260	°C	2

1. Determined according to JEDEC Standard JESD22-A103, High Temperature Storage Life.
2. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

4.2 Moisture handling ratings

Table 4. Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	1

1. Determined according to IPC/JEDEC Standard J-STD-020, Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices.

4.3 ESD handling ratings

Table 5. ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
VHBM	Electrostatic discharge voltage, human body model	-8000	8000	V	1
VCDM	Electrostatic discharge voltage, charged-device model	-750	750	V	2
ILAT	Latch-up current at ambient temperature of 125°C	-200	200	mA	3

1. Determined according to AEC-Q100-002-D, HUMAN BODY MODEL ELECTROSTATIC DISCHARGE TEST.
2. Determined according to AEC-Q100-011-C1, CHARGED DEVICE MODEL (CDM) ELECTROSTATIC DISCHARGE TEST.
3. Determined according to AEC-Q100-004-D, IC LATCH-UP TEST.
 - Test was performed at 125 °C case temperature (Class II).
 - Supply groups pass 1.5 Vccmax.

4.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause

permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either VSS or VDD) or the programmable pullup resistor associated with the pin is enabled.

Table 6. Voltage and current operating ratings

Symbol	Description	Min.	Max.	Unit
V _{DD}	Digital supply voltage	-0.3	6	V
I _{DD}	Maximum current into V _{DD}	—	60	mA
V _{IN}	Input voltage except true open drain pins	-0.3	V _{DD} + 0.3 ¹	V
	Input voltage of true open drain pins	-0.3	V _{DD} + 0.3 ¹	V
I _D	Instantaneous maximum current single pin limit (applies to all port pins)	-20	20	mA
V _{DDA}	Analog supply voltage	V _{DD} - 0.3	V _{DD} + 0.3	V

1. Maximum rating of V_{DD} also applies to V_{IN}.

5 General

5.1 Nonswitching electrical specifications

5.1.1 Power and ground pins

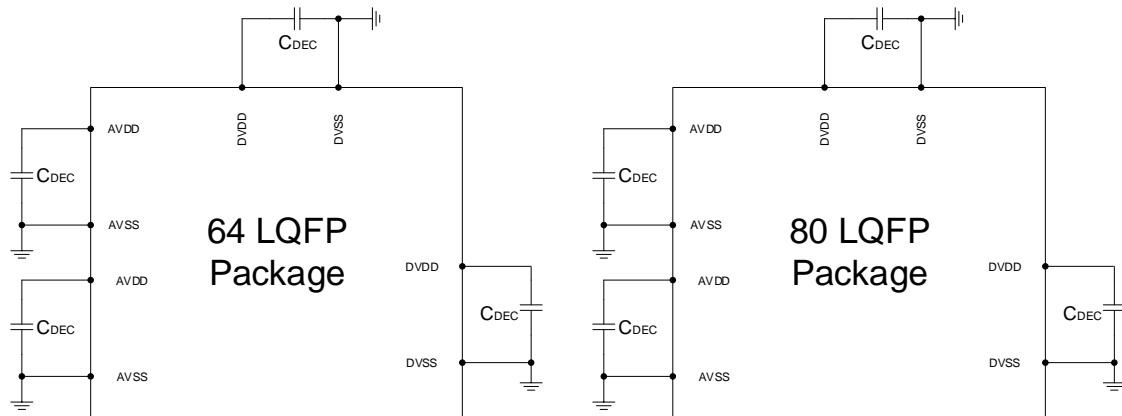

Figure 1. Pinout decoupling

1. DVDD and AVDD must be shorted to a common source on PCB.
2. All decoupling capacitors must be low ESR ceramic capacitors (X7R type) , the recommended value is 0.1 uF.
3. For improved performance, it is recommended to use 10 uF,0.1 uF and 1 nF capacitors in parallel.
4. All decoupling capacitors should be placed as close as possible to the corresponding power and ground pins.

5.1.2 DC characteristics

This section includes information about power supply requirements and I/O pin characteristics.

5.2 Switching specifications

5.2.1 Control timing

Table 10. Control timing

Num	C	Rating	Symbol	Min	Typical ¹	Max	Unit
1	D	System and core clock ($t_{sys} = 1/f_{sys}$)	f_{sys}	DC	—	100	MHz
2	P	Bus frequency ($t_{cyc} = 1/f_{bus}$)	f_{bus}	DC	—	50	MHz

	C	Port rise and fall time - high drive strength(load = 50 pF) ⁴	—	t_{Rise}	—	5.4	ns
	C		—	t_{Fall}	—	4.6	ns

1. Typical values are based on characterization data at VDD = 5.0 V, 25 °C unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a RESET pin request.

- This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized.
- Timing is shown with respect to 20% VDD and 80% VDD levels. Temperature range -40 °C to 125 °C.

5.2.2 PWM module timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the PWM clock.

Table 11. PWM input timing

C	Function	Symbol	Min	Max	Unit
D	Timer clock frequency	f_{PWM}	-	48M	Hz
D	External clock frequency	f_{Tclk}	0	$f_{PWM}/4$	Hz

D	External clock low time	t_{clkl}	1.5	—	t_{PWM}
D	Input capture pulse width	t_{ICPW}	1.5	—	t_{PWM}

1. $t_{PWM} = 1 / f_{PWM}$.

5.3 Thermal specifications

5.3.1 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take P_{I/O} into account in power calculations, determine the difference between actual pin voltage and VSS or VDD and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and VSS or VDD will be very small.

Table 12. Thermal characteristics

Board type	Symbol	Description	64	80	Unit	Notes
			LQFP	LQFP		
Single-layer (1S)	R _{θJA}	Thermal resistance, junction to ambient (natural convection)	71	57	°C/W	1, 2
Four-layer (2s2p)	R _{θJA}	Thermal resistance, junction to ambient (natural convection)	53	44	°C/W	1, 3
Single-layer (1S)	R _{θJMA}	Thermal resistance, junction to ambient (200 ft./min. air speed)	59	47	°C/W	1, 3
Four-layer (2s2p)	R _{θJMA}	Thermal resistance, junction to ambient (200 ft./min. air speed)	46	38	°C/W	1, 3
—	R _{θJB}	Thermal resistance, junction to board	35	28	°C/W	4
—	R _{θJC}	Thermal resistance, junction to case	20	15	°C/W	5
—	Ψ _{JT}	Thermal characterization parameter, junction to package top outside center (natural convection)	5	3	°C/W	6

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \text{ Where:}$$

T_A = Ambient temperature, °C

θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W

$$P_D = P_{int} + P_{I/O}$$

P_{int} = I_{DD} × V_{DD}, Watts - chip internal power

P_{I/O} = Power dissipation on input and output pins - user determined

For most applications, P_{I/O} << P_{int} and can be neglected. An approximate relationship between P_D and T_J (if P_{I/O} is neglected) is:

$$P_D = K \div (T_J + 273 \text{ °C})$$

Solving the equations above for K gives: $K = P_D \times (T_A + 273 \text{ °C}) + \theta_{JA} \times (P_D)^2$

where K is a constant pertaining to the particular part. K can be determined by measuring

P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving the above equations iteratively for any value of T_A.

6.2 External oscillator (OSC) and ICS characteristics

6.2.1 External oscillator(OSC) characteristics

Table 14. OSC specifications (temperature range = -40 to 125 °C ambient)

Num	C	Characteristic	Symbol	Min	Typical	Max	Unit
1	C	Crystal frequency	f _{hi}	4	—	30	MHz
2	D	Load capacitors	CL1, CL2	See Note ¹			
3	D	Series resistor	R _s	—	0	—	kΩ
4	C	Crystal start-up time	t _{cst}		3		ms

Note 1: For CL1 and CL2, it is recommended to use high-quality external ceramic capacitors designed for high-frequency applications, and selected to match the requirements of the crystal. CL1 and CL2 are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of CL1 and CL2. PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing CL1 and CL2.

6.5 Communication interfaces

6.5.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown

with respect to 20% VDD and 80% VDD, unless noted, and 25 pF load on all SPI pins. All timing assumes slew rate control is disabled and high-drive strength is enabled for SPI output pins.

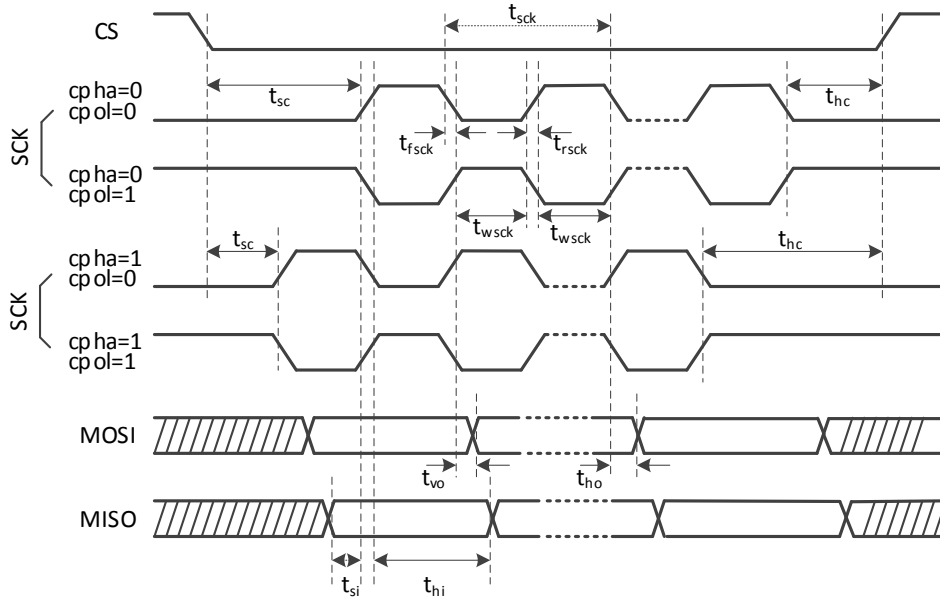

Figure 6. SPI timing diagram – master
